Multi-view geometry

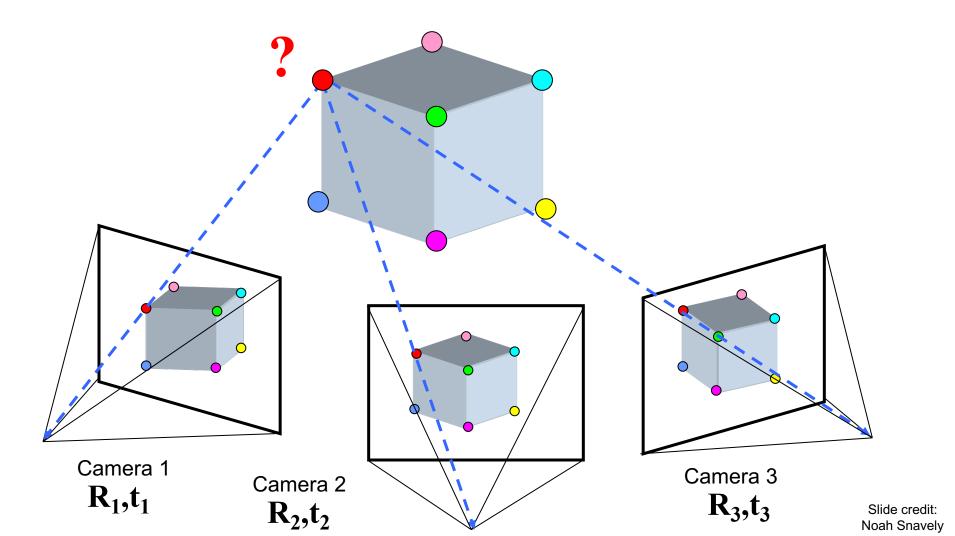

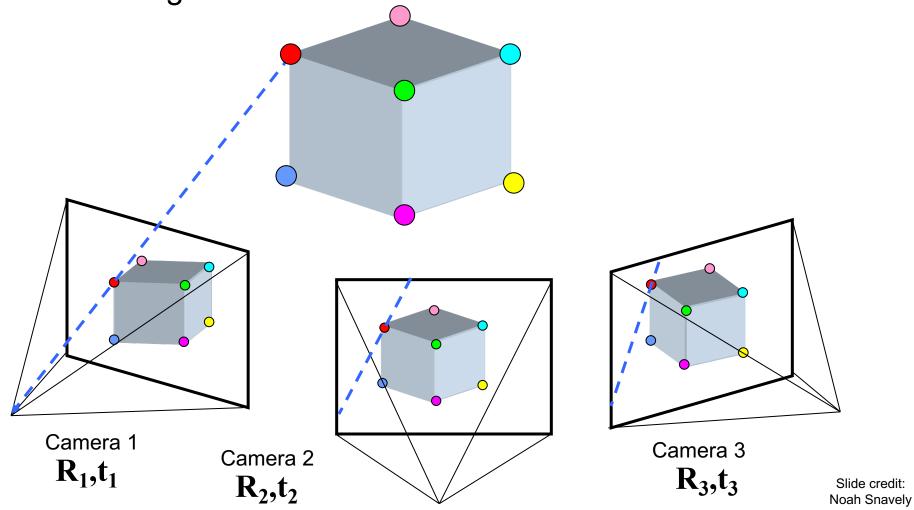

Multi-view geometry problems

• **Structure:** Given projections of the same 3D point in two or more images, compute the 3D coordinates of that point

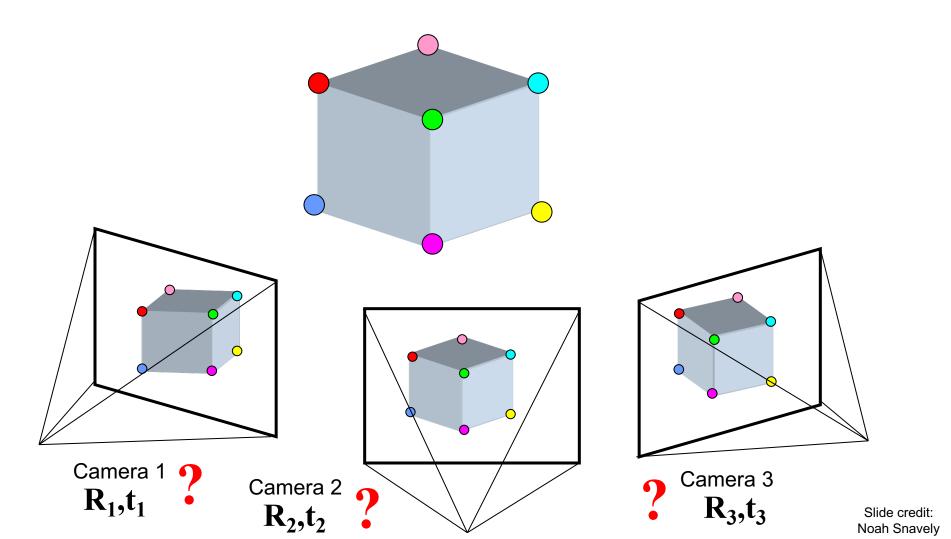

Multi-view geometry problems

• Stereo correspondence: Given a point in one of the images, where could its corresponding points be in the other images?

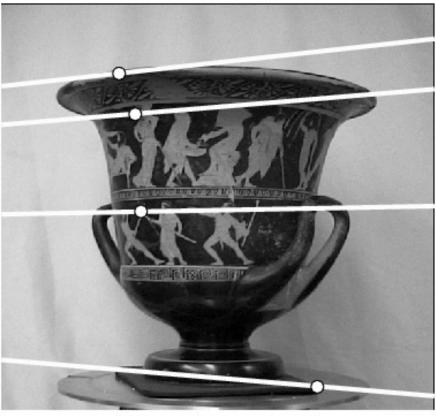

Multi-view geometry problems

 Motion: Given a set of corresponding points in two or more images, compute the camera parameters

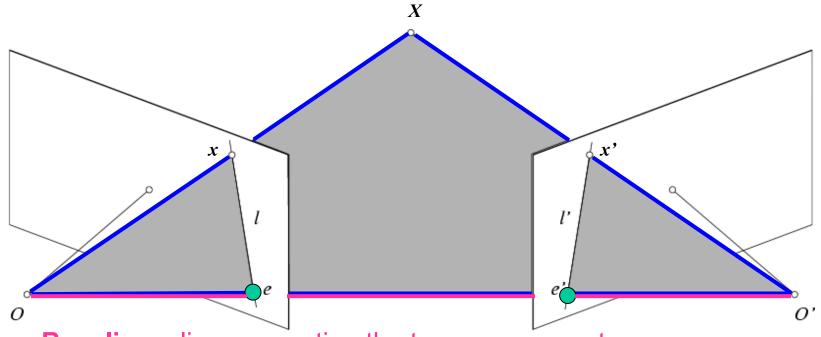

Two-view geometry

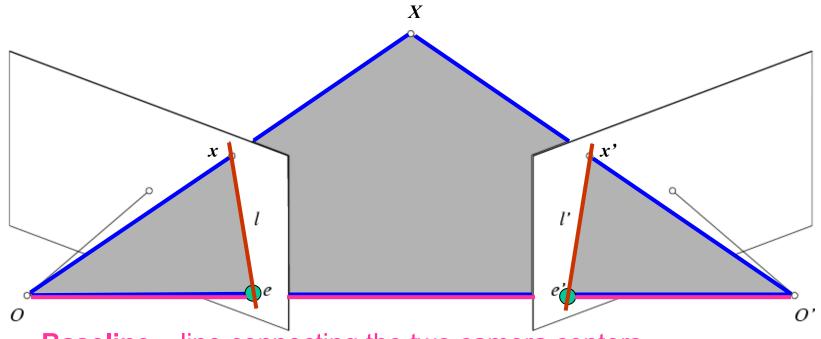

Epipolar geometry

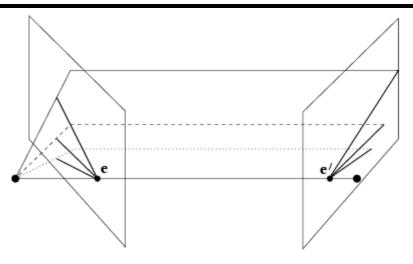

- Baseline line connecting the two camera centers
- Epipolar Plane plane containing baseline (1D family)
- Epipoles
- = intersections of baseline with image planes
- = projections of the other camera center

Epipolar geometry

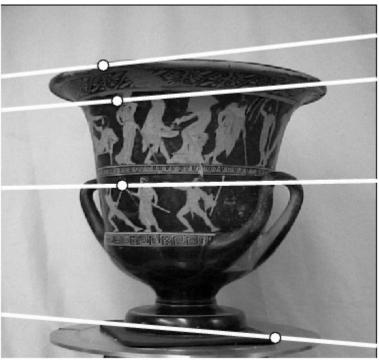

- Baseline line connecting the two camera centers
- Epipolar Plane plane containing baseline (1D family)
- Epipoles
- = intersections of baseline with image planes
- = projections of the other camera center
- **Epipolar Lines** intersections of epipolar plane with image planes (always come in corresponding pairs)

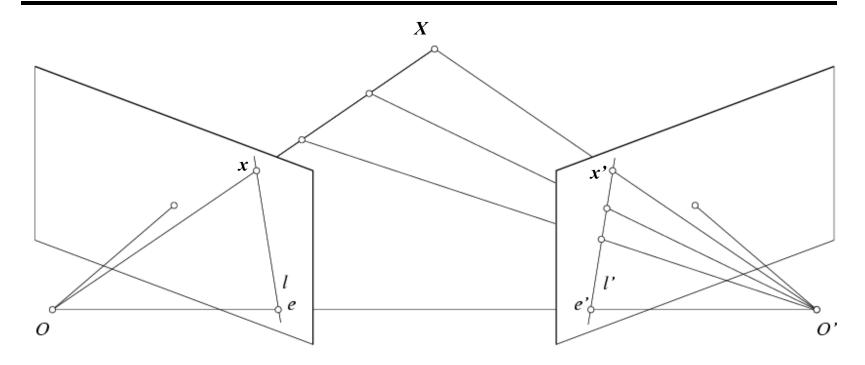

Example: Converging cameras

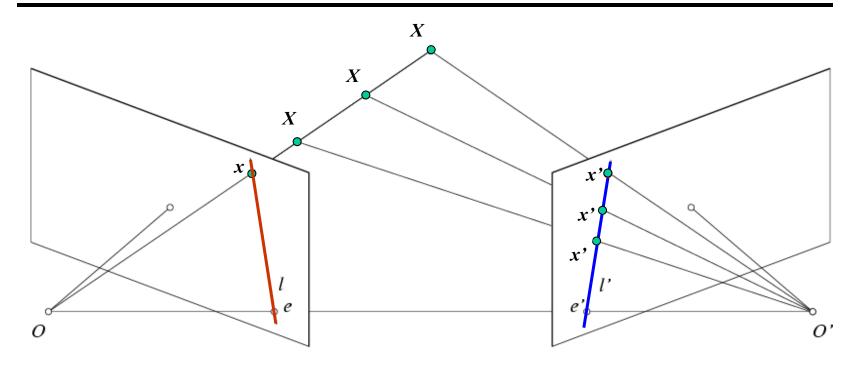

Epipolar constraint

 If we observe a point x in one image, where can the corresponding point x' be in the other image?

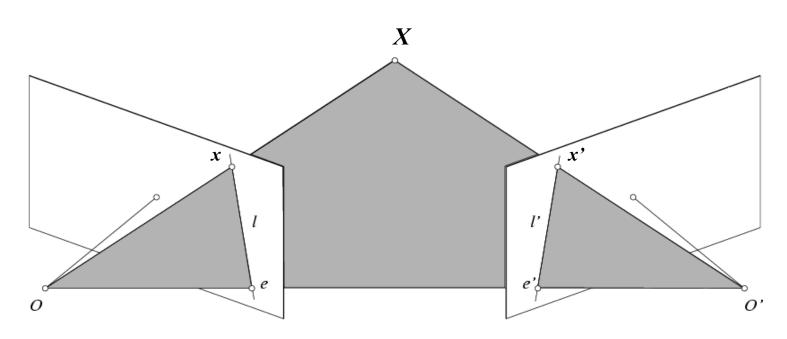

Epipolar constraint

- Potential matches for **x** have to lie on the corresponding epipolar line **I**'.
- Potential matches for x' have to lie on the corresponding epipolar line I.

Epipolar constraint example

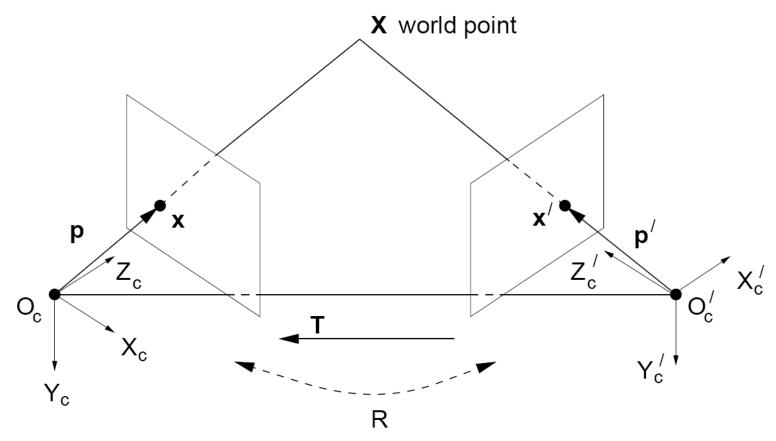

- Intrinsic and extrinsic parameters of the cameras are known, world coordinate system is set to that of the first camera
- Then the projection matrices are given by K[I | 0] and K'[R | t]
- We can multiply the projection matrices (and the image points) by the inverse of the calibration matrices to get *normalized* image coordinates:

$$x_{\text{norm}} = K^{-1}x_{\text{pixel}} = [I \ 0]X, \qquad x'_{\text{norm}} = K'^{-1}x'_{\text{pixel}} = [R \ t]X$$

Stereo geometry, with calibrated cameras

If the stereo rig is calibrated, we know: how to **rotate** and **translate** camera reference frame 1 to get to camera reference frame 2. $\mathbf{X'} = \mathbf{RX} + \mathbf{T}$

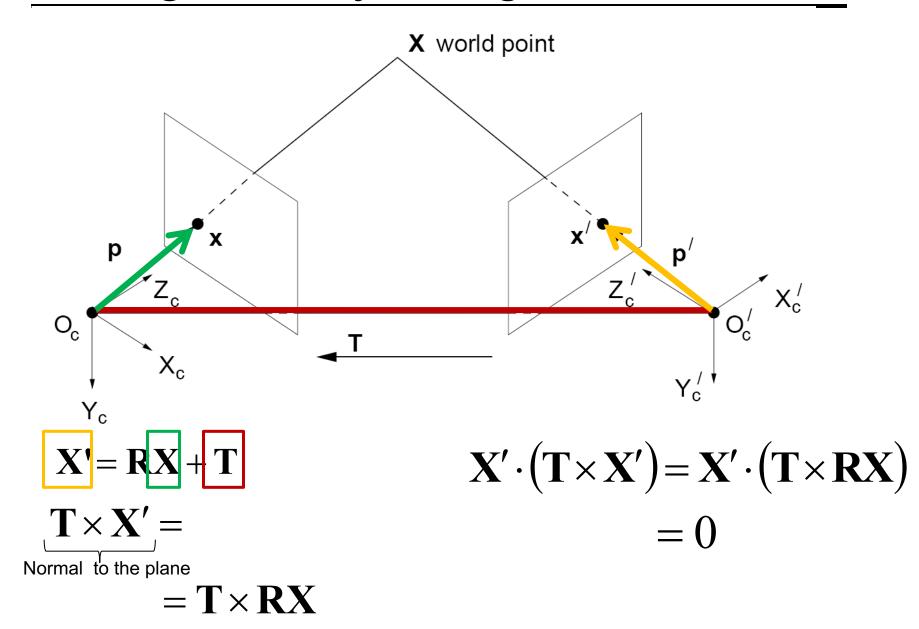

An aside: cross product

$$\vec{a} \times \vec{b} = \vec{c} \qquad \qquad \vec{a} \cdot \vec{c} = 0$$
$$\vec{b} \cdot \vec{c} = 0$$

Vector cross product takes two vectors and returns a third vector that's perpendicular to both inputs.

So here, c is perpendicular to both a and b, which means the dot product = 0.

From geometry to algebra

Another aside:

Matrix form of cross product

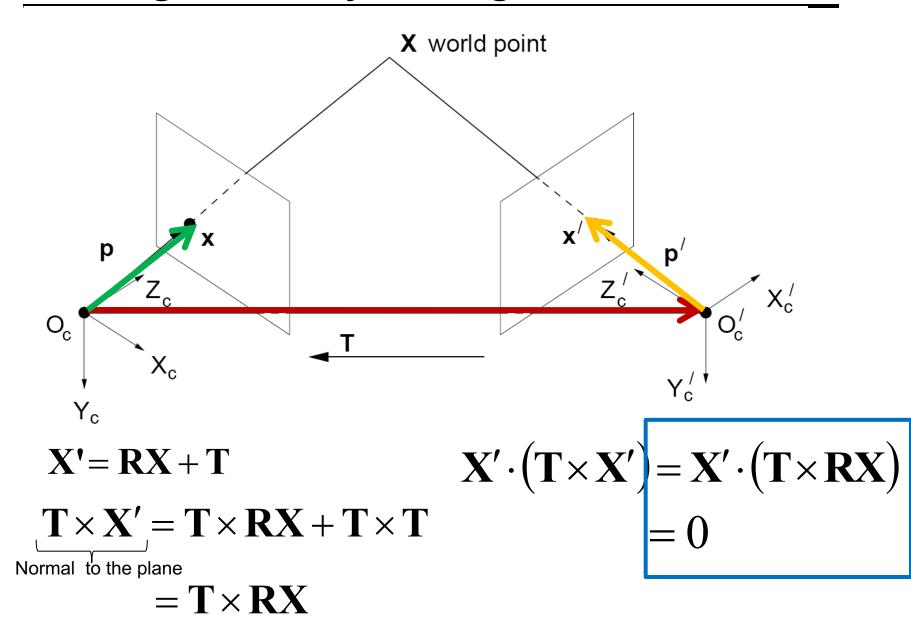

$$\vec{a} \times \vec{b} = \begin{bmatrix} 0 & -a_3 & a_2 \\ a_3 & 0 & -a_1 \\ -a_2 & a_1 & 0 \end{bmatrix} \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} = \vec{c} \qquad \vec{a} \cdot \vec{c} = 0$$

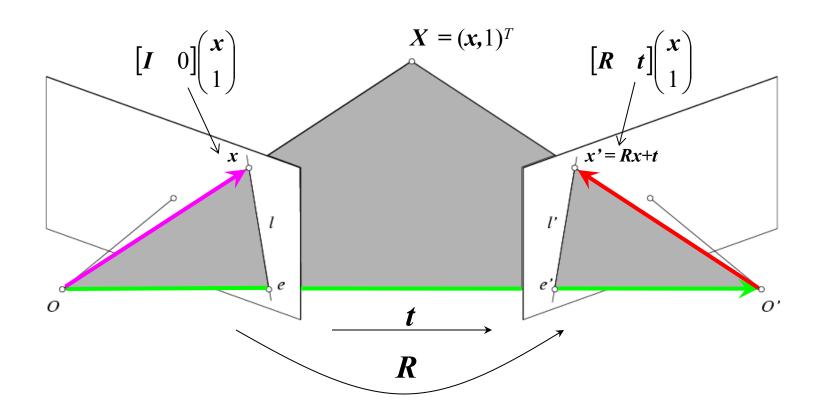

Can be expressed as a matrix multiplication.

$$[a_x] = \begin{bmatrix} 0 & -a_3 & a_2 \\ a_3 & 0 & -a_1 \\ -a_2 & a_1 & 0 \end{bmatrix} \quad \vec{a} \times \vec{b} = [a_x] \vec{b}$$

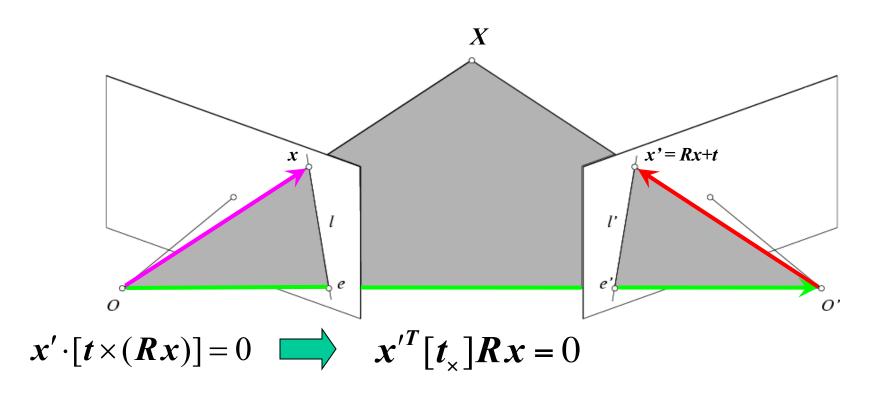

$$\vec{a} \times \vec{b} = [a_x]\vec{b}$$

From geometry to algebra

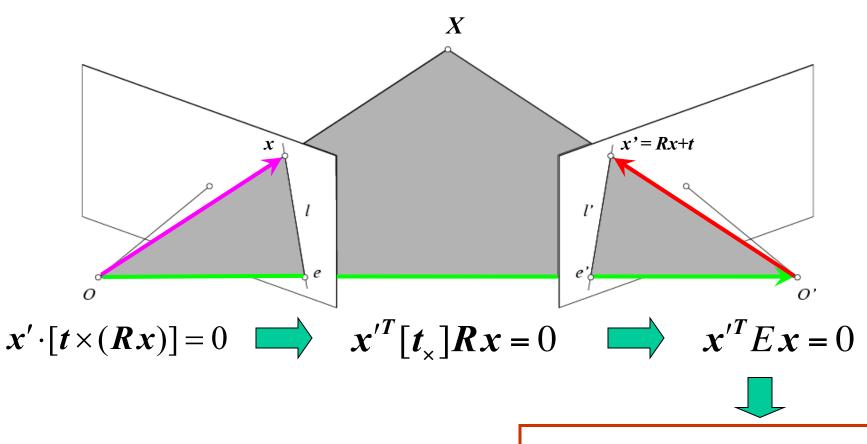

The vectors Rx, t, and x' are coplanar

Recall:
$$\mathbf{a} \times \mathbf{b} = \begin{bmatrix} 0 & -a_z & a_y \\ a_z & 0 & -a_x \\ -a_y & a_x & 0 \end{bmatrix} \begin{bmatrix} b_x \\ b_y \\ b_z \end{bmatrix} = [\mathbf{a}_{\times}]\mathbf{b}$$

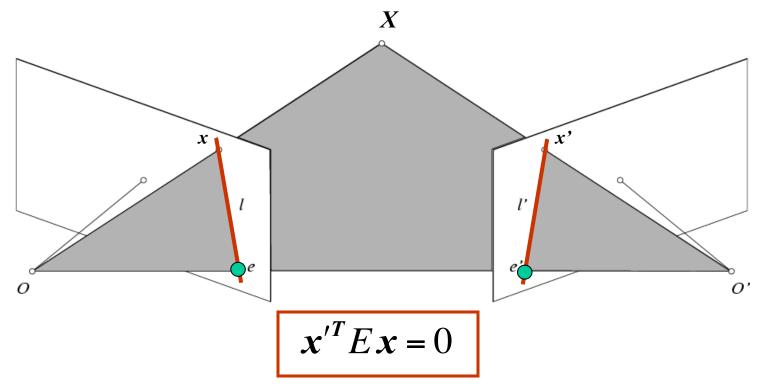

The vectors Rx, t, and x' are coplanar

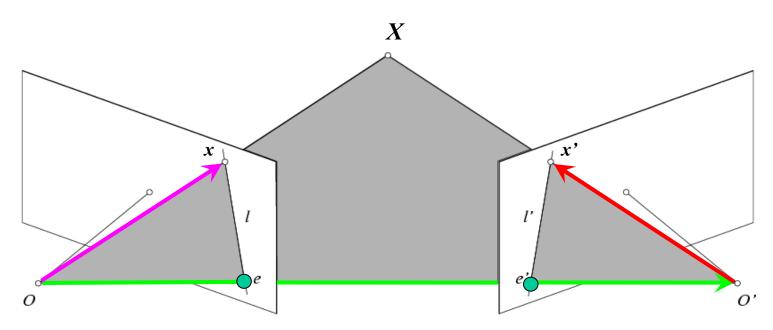

Essential Matrix

(Longuet-Higgins, 1981)

The vectors Rx, t, and x' are coplanar

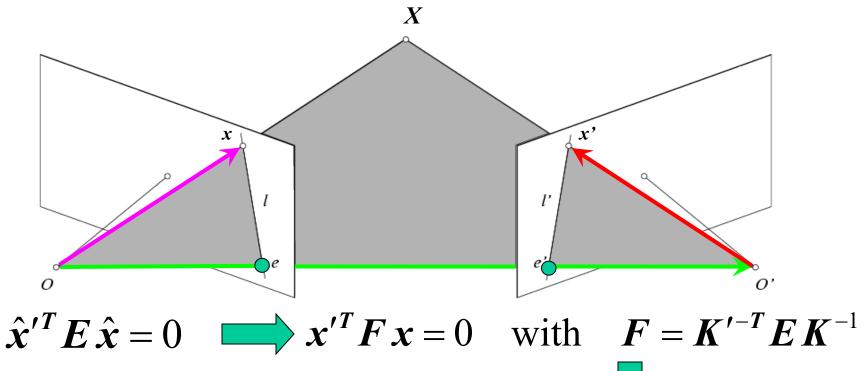

- E x is the epipolar line associated with x (I' = E x)
- E^Tx' is the epipolar line associated with x' ($I = E^Tx'$)
- E e = 0 and $E^T e' = 0$
- **E** is singular (rank two)
- E has five degrees of freedom

- The calibration matrices K and K' of the two cameras are unknown
- We can write the epipolar constraint in terms of unknown normalized coordinates:

$$\hat{\boldsymbol{x}}'^T \boldsymbol{E} \, \hat{\boldsymbol{x}} = 0 \qquad \hat{\boldsymbol{x}} = \boldsymbol{K}^{-1} \boldsymbol{x}, \quad \hat{\boldsymbol{x}}' = \boldsymbol{K}'^{-1} \boldsymbol{x}'$$

$$\hat{\boldsymbol{x}} = \boldsymbol{K}^{-1} \boldsymbol{x}$$

$$\hat{\boldsymbol{x}}' = \boldsymbol{K}'^{-1} \boldsymbol{x}'$$

Fundamental Matrix

(Faugeras and Luong, 1992)

Estimating the fundamental matrix

The eight-point algorithm

$$\mathbf{x} = (u, v, 1)^{T}, \quad \mathbf{x}' = (u', v', 1)$$

$$\begin{bmatrix} u' & v' & 1 \end{bmatrix} \begin{bmatrix} f_{11} & f_{12} & f_{13} \\ f_{21} & f_{22} & f_{23} \\ f_{31} & f_{32} & f_{33} \end{bmatrix} \begin{bmatrix} u \\ v \\ 1 \end{bmatrix} = 0$$

$$\begin{bmatrix} u'u & u'v & u' & v'u & v'v & v' & u & v & 1 \end{bmatrix} \begin{bmatrix} f_{11} \\ f_{12} \\ f_{13} \\ f_{21} \\ f_{22} \\ f_{23} \\ f_{21} \end{bmatrix} = 0$$
Solve homogeneous

Enforce rank-2 constraint (take SVD of *F* and throw out the smallest singular value)

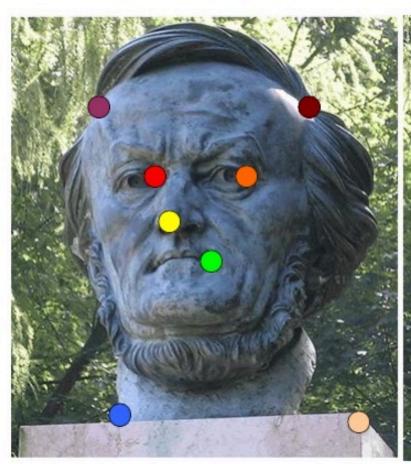

linear system using

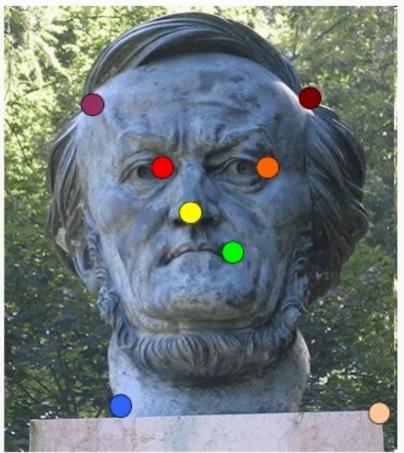

eight or more matches

Problem with eight-point algorithm

$$\begin{bmatrix} u'u & u'v & u' & v'u & v'v & v' & u & v \end{bmatrix} \begin{bmatrix} f_{11} \\ f_{12} \\ f_{13} \\ f_{21} \\ f_{22} \\ f_{23} \\ f_{31} \\ f_{32} \end{bmatrix} = -1$$

f_{12} \\
f_{13} \\
f_{21} \\
f_{22} \\
f_{23} \\
f_{31} \\
f_{32}
\end{bmatrix} = -1$$

Poor numerical conditioning

Can be fixed by rescaling the data

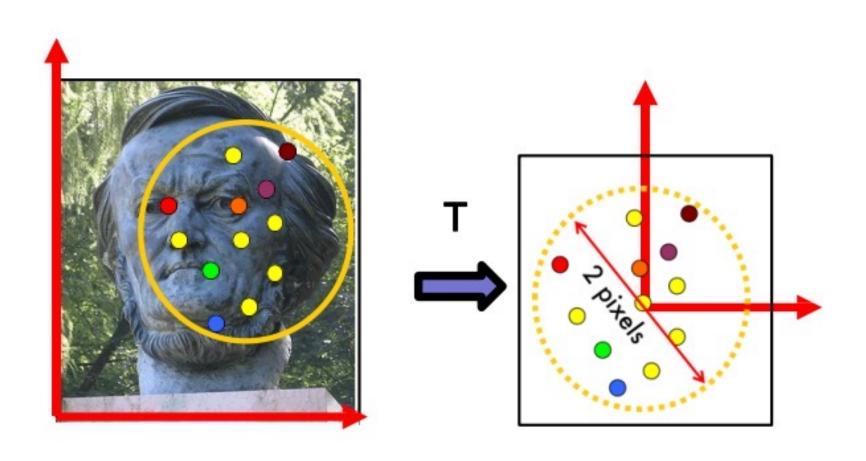

The normalized eight-point algorithm

(Hartley, 1995)

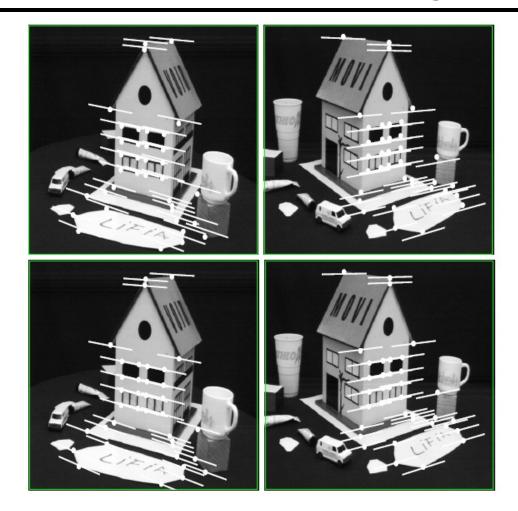

- Center the image data at the origin, and scale it so the mean squared distance between the origin and the data points is 2 pixels
- Use the eight-point algorithm to compute F from the normalized points
- Enforce the rank-2 constraint (for example, take SVD of *F* and throw out the smallest singular value)
- Transform fundamental matrix back to original units:
 if *T* and *T'* are the normalizing transformations in the
 two images, than the fundamental matrix in original
 coordinates is *T'^T F T*

The normalized eight-point algorithm

(Hartley, 1995)

Comparison of estimation algorithms

	8-point	Normalized 8-point	Nonlinear least squares
Av. Dist. 1	2.33 pixels	0.92 pixel	0.86 pixel
Av. Dist. 2	2.18 pixels	0.85 pixel	0.80 pixel

From epipolar geometry to camera calibration

- Estimating the fundamental matrix is known as "weak calibration"
- If we know the calibration matrices of the two cameras, we can estimate the essential matrix: *E* = *K*^{'T}*FK*
- The essential matrix gives us the relative rotation and translation between the cameras, or their extrinsic parameters
